

ASBESTOS

By Robert L. Virta

Domestic survey data and tables were prepared by Subina W. Pandey, statistical assistant, and the world production table was prepared by Regina R. Coleman, international data coordinator.

Asbestos had not been mined in the United States since 2002, so the domestic manufacturing sector was entirely dependent on imported asbestos, most of which came from Canada. U.S. apparent consumption declined to 3,450 metric tons (t) in 2004. World production was estimated to be 2.23 million metric tons (Mt), unchanged from that of 2003.

Legislation and Government Programs

Debate continued in the U.S. Congress on asbestos issues. Key points of discussion were whether or not to ban the use of asbestos and asbestos products in the United States, compensation for workers and the general public who suffer from asbestos-related disease, and foremost, how to deal with the large amount of asbestos litigation in the U.S. court system. While the topic was debated in committee, no new bills on these issues were introduced onto the floor of the U.S. House of Representatives or the U.S. Senate in 2004.

The Agency for Toxic Substances and Disease Registry, part of the U.S. Department of Health and Human Services, and the U.S. Environmental Protection Agency (EPA) continued health studies of residents and former vermiculite miners and millers in Libby, MT. The EPA continued its cleanup of asbestos-contaminated properties in Libby, MT, as well as its health studies of workers at vermiculite exfoliation plants located throughout the United States. The studies were initiated when asbestos-related diseases were diagnosed in mine workers and portions of the population in Libby, MT, where they were exposed to vermiculite that was contaminated with asbestos (Agency for Toxic Substances and Disease Registry, 2004¹; U.S. Environmental Protection Agency, 2004[§]).

The Mine Safety and Health Administration continued to evaluate its proposed reduction of the 8-hour time-weighted average permissible exposure level to 0.1 fiber per cubic centimeter (f/cm³) from 2 f/cm³ for asbestos. A decision had not yet been made on this proposal at the time of publication (U.S. Department of Labor, 2004[§]).

A United Nations committee decided not to include chrysotile under the prior informed consent (PIC) procedure of the Rotterdam Convention for Certain Hazardous Chemicals and Pesticides in International Trade. The PIC procedure recommends that countries exporting PIC-listed chemicals notify importing countries of the hazardous content before shipment occurs. The importing country would then decide whether or not to accept the shipment. The committee voted to add actinolite asbestos, amosite, anthophyllite asbestos, and tremolite asbestos to its PIC list, which already included crocidolite (Chrysotile Institute, 2004[§]).

A study by the U.S. Geological Survey determined that geologic setting is a good indicator of whether or not amphibole asbestos may be present in a talc deposit. Talc deposits formed when siliceous hydrothermal fluids altered dolostone generally did not contain amphiboles or their content is negligible. Talc deposits formed by contact or regional metamorphism consistently contained amphiboles, many of which may be asbestiform. This relation between mode of formation and amphibole content is useful as a screening tool when evaluating talc deposits for their potential to contain asbestos minerals (Van Gosen, Lowers, and Sutley, 2004, p. 936-937).

Consumption

U.S. consumption of asbestos was 3,450 t in 2004, a decrease from 4,650 t in 2003 (table 1). Coating and compounds accounted for 21% of U.S. consumption, roofing products accounted for 43% of consumption, and other uses for 36%. The other uses category was larger than in prior years because end uses were not known for the 1,190 t of asbestos imported from Germany, South Africa, and Zimbabwe. As for the past 2 to 3 years, it is believed that roofing product applications, primarily in the form of asphalt roof coatings and sealants, were the leading U.S. markets. Chrysotile was the only type of asbestos used in the United States. More than 80% of the chrysotile used in 2004 was grade 7, followed by grades 5 and 4 (table 2).

Prices

The average free alongside ship (f.a.s.) unit value of asbestos fiber exports and reexports was \$211 per metric ton in 2004, a decrease from \$326 per ton in 2003. The unit value of exports declined because of low-value shipments to Mexico, which accounted for 98% of the export tonnage and 95% of the export value. The average U.S. customs unit value for all grades of imported asbestos decreased to \$234 per ton in 2004 from \$1,260 per ton in 2003. The average value of imported crude chrysotile decreased to \$46 per ton in 2004 from \$172 per ton in 2003 because of unusually low-value transshipments through Germany. The average unit value for imports of spinning-grade chrysotile from all sources was \$150 per ton in 2004, unchanged from that of 2003. The unit value of other

¹References that include a section mark (§) are found in the Internet References Cited section.

grades of chrysotile from all sources decreased to \$318 per ton in 2004 from \$1,380 per ton in 2003 because of low-value shipments from Canada (table 6). Average prices for chrysotile imported from Canada, which compose 66% of U.S. imports, are given in table 3.

Foreign Trade

Imports of asbestos products and products manufactured using asbestos substitutes are reported under the same Harmonized Tariff Schedule (HTS) codes (U.S. Census Bureau, 2001§). With the decline in use of asbestos products in the United States and bans on the manufacture of asbestos products in many other countries, it is likely that products manufactured using asbestos substitutes account for a significant portion of the product imports under some HTS categories. This fact must be taken into consideration when evaluating the trade data that follow.

The f.a.s. value of exported asbestos fibers decreased to \$333,000 in 2004 from \$920,000 in 2003. Mexico was the leading importer of asbestos fiber from the United States. Canada was the leading importer of U.S. products manufactured using asbestos or asbestos substitutes, followed by Mexico, Japan, Thailand, the Republic of Korea, Germany, the United Kingdom, Saudi Arabia, Brazil, and Australia. These ten countries accounted for 83% of the value of manufactured products reexported from the United States in 2004 (table 4).

In 2004, approximately 1,580 t of asbestos was exported (U.S. International Trade Commission, 2004§). The exports included asbestos crudes, fiber, sand, refuse, and stucco. There has been no U.S. production since 2002 so exports were either from stockpiles or were reexports of imported fiber (table 5).

Brake linings, clutch linings, disk pads, mounted brake linings manufactured using asbestos, other mineral substances, or cellulose accounted for 81% of the value of manufactured products that were exported or reexported in 2004 (table 5). Products in these categories composed more than 80% of the value of exports to Australia, Brazil, Canada, Germany, Japan, the Republic of Korea, Mexico, Saudi Arabia, Thailand, and the United Kingdom.

In 2004, Canada supplied 66% of the asbestos imported by the United States. Asbestos also was imported from Germany (1,020 t), South Africa (122 t), and Zimbabwe (45 t) (table 6). There were probably only transshipments through Germany. Only chrysotile was imported into the United States in 2004. Asbestos listed under “Other, unspecified asbestos type” in table 6 probably was chrysotile based on the import sources.

The United States also imported \$615 million worth of products with a basis of asbestos, asbestos and magnesium carbonate, cellulose fiber, or other mineral substances (U.S. International Trade Commission, 2004§) (table 7).

World Review

World production of asbestos was estimated to be 2.23 Mt in 2004, unchanged from that of 2003. Russia continued to be the leading producer of asbestos, followed by China, Kazakhstan, Canada, Brazil, and Zimbabwe. These countries accounted for 95% of the world production (table 8). LAB Chrysotile Inc. announced that it would close its Black Lake asbestos mine near Thetford Mines, Quebec, Canada, for an indefinite time period. Reasons for the decision include increasingly strict exposure standards and increased international competition (Mining Engineering, 2004).

Outlook

Domestic use of asbestos probably will continue its downward trend in the United States because of liability issues. Although asbestos-based products continue to be imported into the United States, their use probably will decline because of public opposition to asbestos use and liability issues. Efforts to ban the use of asbestos are continuing worldwide but chrysotile producers and consumers are working to counteract these initiatives.
